

- He felt that it might have been a good idea to recognise those 3 user interfaces, customer, manager.
- If we do it in a monolithic app only thing to prevent customers from accessing administrative components is authentication. He seems to want to go to 2 separate apps (application and web portal (for managers)).
- There is an extra iteration that has no penalty, but we got to ask for it - if we NEED it.
- For revised documents create a change log at the top of the document, even small changes need to be different changes in the change log not just one or two big ones.
- To record the changes, we could turn on change tracking and highlight the changes.
- The revised documents are not just getting more marks they are to represent the changes we decided e.g. the transition from two apps to one.
- Make sure we coordinate what that data structure is. Make sure Jake and Emily coordinate on what data is coming through.
- Manage menu is a little bit off task because that is an admin function, think about what we need to do for the end to end production level support for the critical core use case.
- He would not worry too much at the moment about the admin functionality – it's not really core for the application that supports “I want to get a cup of coffee”.
- Something that is part of the app is the timing system that will display the amount of time that the order will take to prepare.
- Don't be scared of drawing pictures or sequence diagrams (to Emily for her discussion about the view active order implementation).
- The only risk of taking the next iteration, if it doesn't work out by then it can be a problem, after the exam period its marks are supposed to be handed in.
- He thinks we do need the extra iteration at the end.
- Minimum is placing an order and it is showing up on the back end.
- Part of elaboration is seeing if our aims are achievable. Now that we know how long things take to do and how complicated it is it is alright to drop things especially modular sections such as the event system.
- No penalty to modifying our project plan and our aims, in light of the experience of the elaboration phase we can alter the scope – it's all about being realistic. We have to explain why but if we think our scope is quite large we can cut it back.
- We are allowed to take a fifth construction iteration; we'd have to compress the transition iterations to 4 weeks (28 days) – 9 day transition iterations.
