

Start at 8:02pm

Short meeting

We are doing the extra iteration

Iteration 6 get functionality and use case supported

Get the function aspects about the project complete this iteration and the extra iteration to complete and fix up any documentation.

Back end - the order is viewable by the staff when a customer orders something.

Should think about the back end quite early in the construction phase.

22nd of June is the final day of extra iteration (Hard Date).

Don't rush the milestone, complete it.

Research based items can just be linked to through Google docs as long as we understand the concept and we are accountable for what we are meant to do.

Evidence based reporting is important.

As long as we have evidence of it Jim is happy.

Final presentation submittables should be hard copy snapshots (like pdfs) and uploaded to version control.

8:15pm

Changelog at top of document (Tells the differences instead of finding them in the document).

Issue by issue basis for like why you changed something to fix an issue.

No penalty for changing something and stating what has happened (Does it reflect reality?).

Big concerns are backing backend and frontend talk together and also our scope considering how small things have been turning into big things using up too much time.

Could take a 5th construction period instead of the first transition period and instead have 3 transition periods are all 9 days.

Complete big risks first so that we can just crank out coding next session.

Does the payment system need to be real? - Ideally get a real one, but as long as you have an interface to a payment subsystem, find how they work and write a generic payment gateway to expose how it works with the real deal. Yes we can dummy it for now.

Research how it works.

Functional Acceptance Tests UAT for internal testers.

Make sure every path is covered, not necessarily every single option.

8:30pm

Make sure we figure out the scope sooner or later, latest end of next iteration.

Still got a little risk but we just need to keep at it.

Ended at 8:36pm
